## Step 2:

### Permission Sets:

- Create two permission sets, one for User A and one for User B.

### Object-Level Security:

- In each profile and permission set, set the object-level security for the Account object to "Read" to ensure that both User A and User B can view Account records.

### Record-Level Security:

- Implement record-level security using Criteria-Based Sharing Rules.
- Create a sharing rule that shares Account records owned by User A with User A and records owned by User B with user B.
- For the sharing rule criteria, specify that records owned by User A are shared with user A, and records owned by User B are shared with User B.

### Ownership:

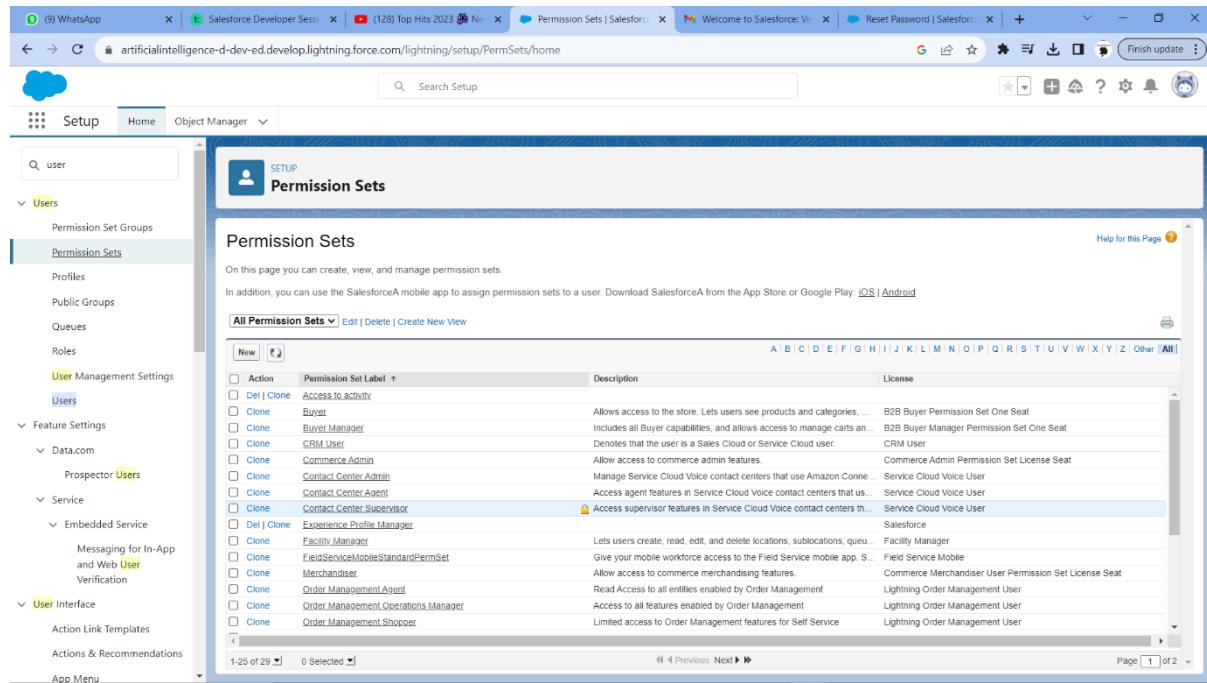

- Ensure that the Account records are owned by the respective users, with User A owning their records and User B owning their records.

## Organization-Wide Defaults:

- Set the organization-wide defaults for the Account object to "Private" to ensure that records are private by default.

## Testing:

- Test the setup by logging in as User A and User B separately to verify that they cannot access each other's records.

The screenshot shows the Salesforce Setup interface with the 'Permission Sets' page open. The left sidebar is collapsed, and the main content area displays a table of permission sets. The table has columns for Action, Permission Set Label, Description, and License. The 'Description' column contains detailed descriptions of the permissions granted by each set. The 'License' column indicates which license is required for each set. The table includes rows for various roles like Buyer, Buyer Manager, CRM User, etc., and specific permission sets like 'Access\_to\_activity' and 'Order Management\_Shopper'.

The main panel displays a 'Create' form for a new permission set. The 'Label' field contains 'user', and the 'API Name' field contains 'User'. The 'Description' field is empty. The 'Session Activation Required' checkbox is unchecked. Below the form, a note asks 'Who will use this permission set?' with three options: 'None', 'Specific user license', and 'Specific permission set license'. A link 'Learn more here.' is provided. The 'License' dropdown is set to '-None-'.

This screenshot is identical to the one above, except the 'Label' field now contains 'salesmanager' and the 'API Name' field also contains 'Salesmanager'. All other fields and settings remain the same.

## Step 7:

Now to give the specific delete access to the user click on edit on the Account and then enable the read,create,edit and the delete on it so that the permission set will have a specific special access on it. once it has been done click on save and then click on manage assignment.

The screenshots illustrate the configuration of a Permission Set in Salesforce:

- Object Permissions:** Under the 'Accounts' object, the 'Delete' permission is initially unchecked.
- Field Permissions:** Under the 'Account' field, both 'Read Access' and 'Edit Access' are checked.

In the second screenshot, the 'Delete' checkbox under Object Permissions is checked. In the third screenshot, the changes are saved.

## Step 8

Now click on add assignment there you will find your two created users click on any one user to give a special access as delete on it and then click on assign so that the specific selected user can have a special access as delete on it.

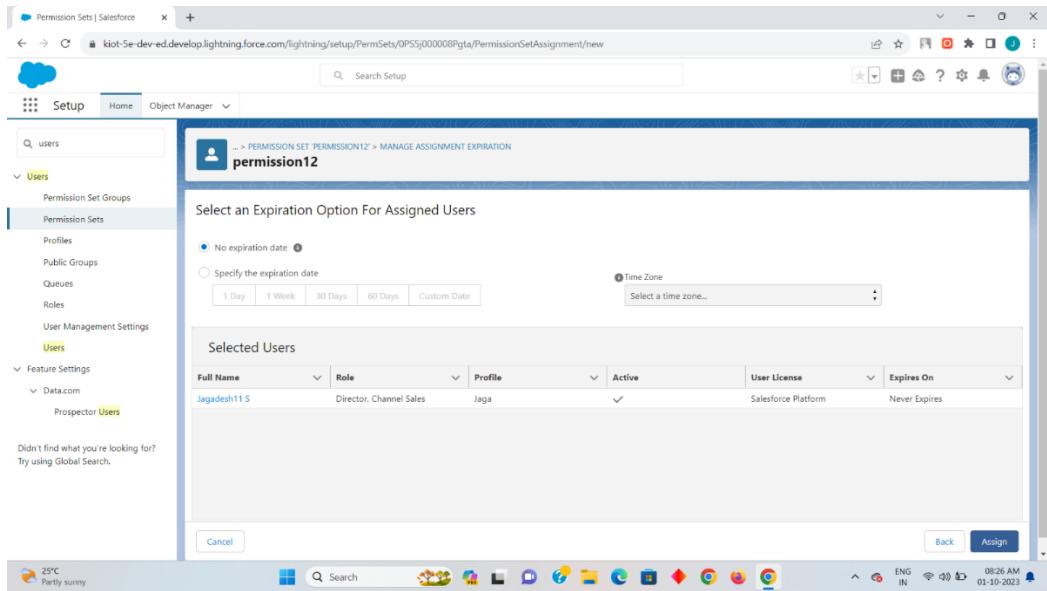

The screenshot shows the 'Permission Sets | Salesforce' page. The left sidebar is expanded, showing 'Users' selected under 'Permission Sets'. The main content area is titled 'permission12' and shows a decorative illustration of a cactus and sun. Below it, a message says 'No assignments defined.' A small note at the bottom left says 'Didn't find what you're looking for? Try using Global Search.'

This screenshot shows the 'PERMISSION SET permission12 > MANAGE ASSIGNMENT EXPIRATION' dialog. It has a title bar 'permission12'. The main area is titled 'Select Users to Assign' and contains a table with user data. A search bar at the top right shows 'jagadesh'. A tooltip above the search bar says 'Roles, Alias, and Profile aren't searchable. Use filters or sort on these fields instead.' The table columns are: Full Name, Alias, Username, Role, Active, and Profile. The first row is highlighted with a blue border.

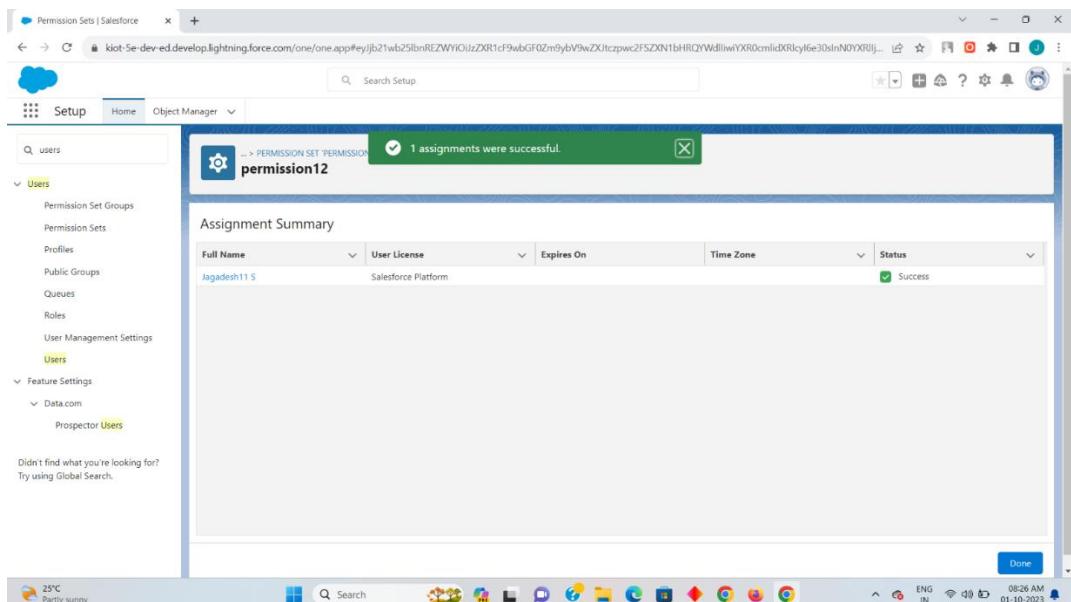

Full Name	Alias	Username	Role	Active	Profile
jagadesh S	JS	w0w@gmail.com	SF Admin	<input checked="" type="checkbox"/>	System Administrator
jagadesh S	JS	jaga1117@gmail.com	Channel Sales Team	<input type="checkbox"/>	Standard Platform User
jagadesh11 S	js	jww123@gmail.com	Director, Channel Sales	<input checked="" type="checkbox"/>	Jaga
jagadesh22 S	js	jaat@gmail.com	Marketing Team	<input checked="" type="checkbox"/>	Jaga

This screenshot shows the same 'PERMISSION SET permission12 > MANAGE ASSIGNMENT EXPIRATION' dialog. The 'Jagadesh11 S' row from the previous screenshot now has a checked checkbox in the 'Active' column. The rest of the interface is identical to the previous screenshot.

Click on next.

Now click on Assign.

Now the specific access for the Jagadesh11 user has been assigned successfully.

## Step 5: Create a Lightning Application to Render Lightning Runtime for Flow in a Visualforce Page

Now we will create a Lightning Application that declares a dependency on the **lightning:flow** component.

1. Click **Setup | Developer Console**
2. Navigate to **File | New | Lightning Application**
3. Enter a **Name (VFPageToLC)** field, make sure to select the **Lightning Out Dependency App** checkbox.
4. Click **Submit**.
5. Copy code from [\*\*GitHub\*\*](#) and paste it into your Lightning Application.
6. **Save** your code.

The screenshot shows the Salesforce IDE interface. At the top, there's a menu bar with options like File, Edit, Debug, Test, Workspace, Help, and navigation arrows. Below the menu is a tab bar with 'VFPageToLC.app \*'. The main area contains the following code:

```
1 <aura:application access="global"
2     extends="ltng:outApp"
3     implements="ltng:allowGuestAccess">
4     <aura:dependency resource="lightning:flow"/>
5 </aura:application>
```

At the bottom of the interface, there's a blue bar labeled 'Logs, Tests, and Problems'.

## Step 6: Create a Visualforce Page and Embed Your Flow Into It

Now we will create a Lightning Application that declares a dependency on the **lightning:flow** component.

Add the Lightning Components for Visualforce JavaScript library to your Visualforce page using the **<apex:includeLightning/>** component. In the Visualforce page, reference the dependency app. Then write a JavaScript function that creates the

# component on the page using `$Lightning.createComponent()`

1. Click **Setup**.
2. In the Quick Find box, type **Visualforce Pages**.
3. Clicks on the **New** button.
4. Copy code from [GitHub](#) and paste it into your visualforce page
5. Click **Save**.

The screenshot shows the Visualforce Page Editor interface. At the top, there's a header with 'Visualforce Page Survey'. Below it is a 'Page Edit' toolbar with buttons for 'Save', 'Quick Save', 'Cancel', 'Where is this used?', 'Component Reference', and 'Preview'. A note 'I = Required Information' is present. The main area has a 'Page Information' section where 'Label' and 'Name' are set to 'Survey', and a 'Description' field is empty. Underneath are checkboxes for 'Available for Lightning Experience, Experience Builder sites, and the mobile app' (checked) and 'Require CSRF protection on GET requests' (unchecked). Below this is a 'Visualforce Markup' tab which contains the following code:

```
<apex:page showheader="false" lightningStylesheets="true">
<html>
<head>
<apex:includeLightning />
<!--Use apex:includeLightning to add the Lightning Components for Visualforce JavaScript library to your Visualforce page-->
</head>
<body class="slds-scope">
<div id="flowContainer" />
<script>
var statusChange = function (event) {
    if(event.getParam("status") === "FINISHED") {
        var outputVariables = event.getParam("outputVariables");
        var key;
        for(key in outputVariables) {
            if(outputVariables[key].name === "myOutput") {
                ...
            }
        }
    }
};
$Lightning.use("c:VFFPageToLC", function() {
    $Lightning.createComponent("lightning:flow", {"onstatuschange":statusChange},
        "flowContainer",
        function (component) {
            component.startFlow("Survey", );
        }
    );
});
</script>
</body>
```
